Product line extension by ROTHENBERGER:

The all new PLASTICUT+ cuts multilayer tubes everywhere, fast and accurately

What began with the well-received introduction of the ROTHENBERGER plastic tube cutter PLASTICUT at the ISH 2009 in Frankfurt now finds its logical completion: The all new PLASTICUT+, already introduced at the Frankfurt fair in a prototype state, now offers the same convincing advantages for cutting multilayer tubes.

Until now, a plumber would use a saw or a pipe shear for cutting MSR tubes. Both methods came with disadvantages that would more often than not lead to unplanned extra work or, even worse, to quality problems in the final result: Pipe ends deformed by pressure, non-angular cuts, inconvenient burr and an uncomfortable tool handling were the order of the day.

"Simplified work, optimized results – these were our two main goals when developing the PLASTICUT line of products", says ROTHENBERGER's product manager Matthias Bambl. "And exactly this puts our company's innovation philosophy in a nutshell: always keep an eye on what comes before and after one stage of work – and never forget the overall result." With the all new PLASTICUT+, the installation craftsman now has a multilayer pipecutting tool at hand that will secure perfect results by utilizing a highest quality, razor sharp metal cutting wheel.

PLASTICUT+ quickly cuts multilayer tubes in diameters ranging from 16 to 32 mm with just a few turns – accurate and smooth without unwanted burring at the pipe ends. The ultra tight tube bedding effectively avoids deformation by self fixation and adjustment, thus banning the danger of damaging the metal layer inside the MSR tube. Corrosion or leaks are a thing of the past – ideal basis for a good measure of high quality work that will always pay at the end. "Especially regarding the follow-up processes such as pressing, PLASICUT+ lays down the basis for sustainable quality", as Matthias Bambl stresses a crucial aspect of the craftsman's daily work.

Other convincing advantages are the compact, ergonomical design, the single-handed application and the non-slip surface that PLASTICUT+ offers. All of this enables safe, quick work, especially when space is limited or difficult to access, even under wet conditions. Working on installations already existing isn't a problem any more. What's more, PLASICUT+'s „Flex Action“-Technology” allows for cutting the most varying pipe types by different suppliers.

PLASTICUT+ is available now at specialized retailers, covering pipe diameters ranging from 16 to 32 mm and also coming in practical multi-size sets.

Every pipe installation professional knows the German based, internationally operating company ROTHENBERGER, the epitome for pipetool expertise for 60 years now. Cutting, connecting, shaping, cleaning, measuring, testing, inspecting: 10 clearly structured product sections cover all applications needed by plumbers, environmental technicians and air condition specialists every day – innovation and quality that both craftsmen and industry will always benefit from.
